Outline

- 1 Introduction
- 2 Studies of Even-Even Nuclei
- 3 In-beam spectroscopy of ^{253}No
- 4 In-beam and decay spectroscopy of ^{255}Lr
- 5 K-Isomerism in ^{254}No
- 6 K-Isomerism in ^{250}Fm
- 7 Future Prospects

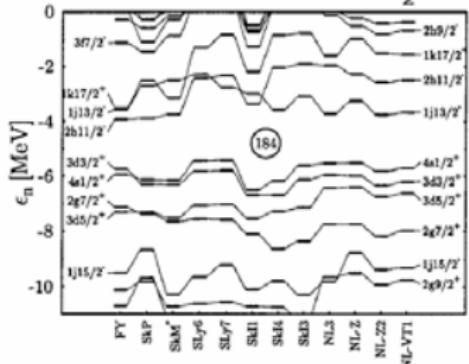

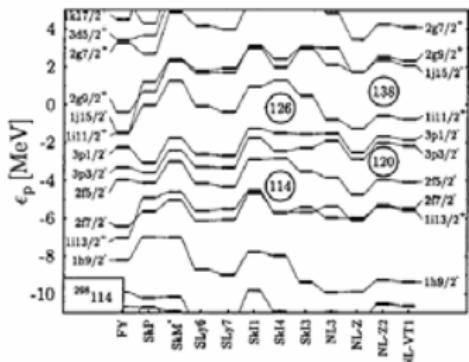

Superheavy Nuclei

- Low statistics
- Favoured α -decays connect states of similar spin/parity
- Isomers prevalent
- Limit for detailed spectroscopy \simeq 100pb
- More detailed studies possible in region of ^{254}No

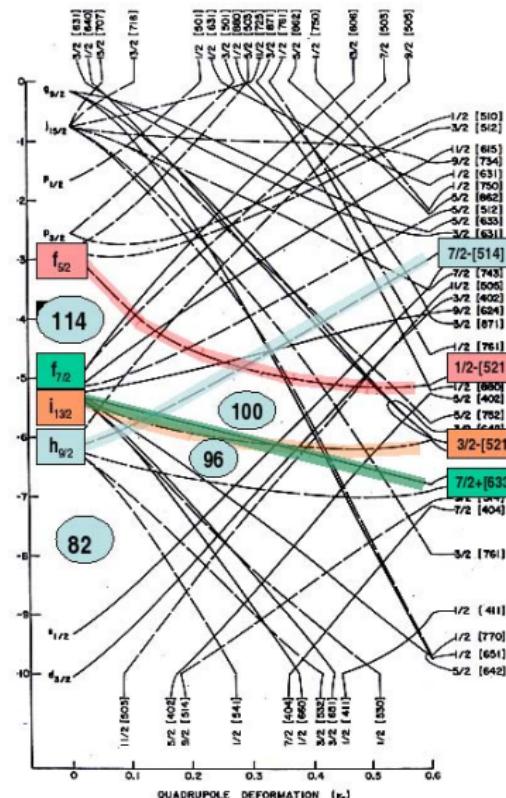

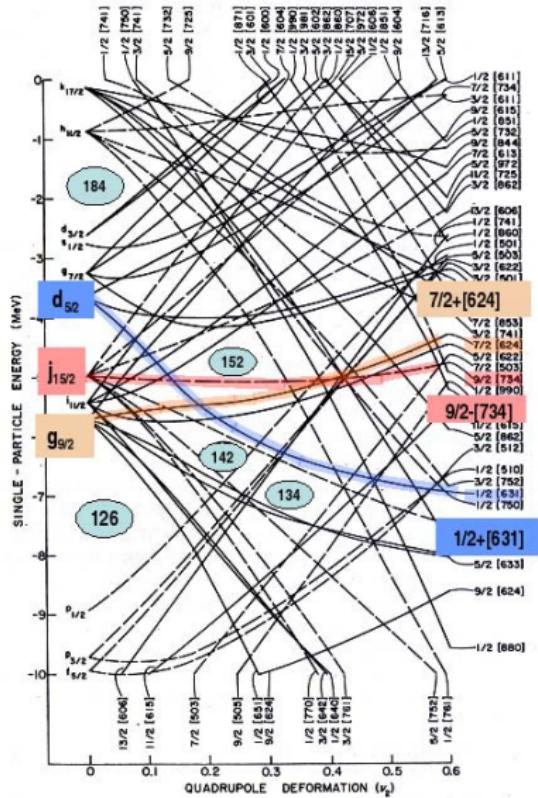

Next Closed Shells?

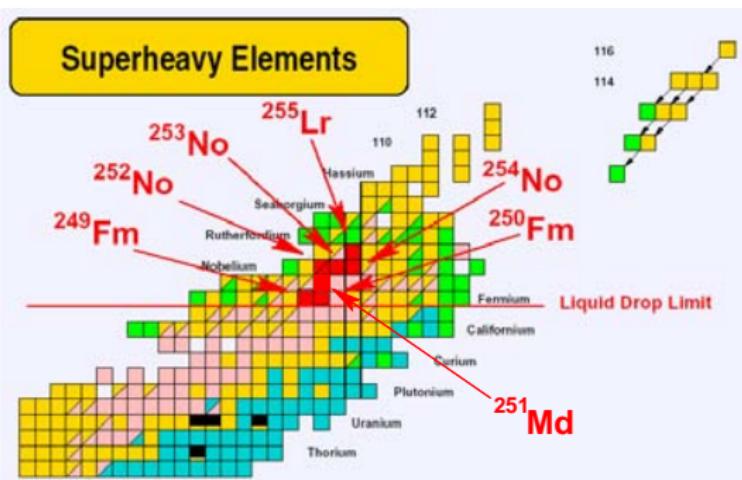

- Various models give different ordering and energies of single-particle states
- Leads to different predictions of next closed shells
- Obtain experimental data to constrain models and determine correct ordering

Moment of Inertia Systematics (Even-Even Nuclei)

- Confirmed deformed nature of nuclei around ^{254}No
- Showed fission barrier robust with spin ($> 20\hbar$)
- Faster alignment at $N=150$ compared to $N=152$ ($\pi i_{13/2}, \nu j_{15/2}$)
- Excellent testing ground for theory; e.g.
Duguet et al., NPA **679**, 427 (2001),
Bender et al., NPA **723**, 354 (2003),
Afanasjev et al., PRC **67**, 024309 (2003),

K-Isomerism in ^{254}No

- Isomeric state with half-life 280 ms first postulated by Ghiorso et al., PRC7 (1973) 2032
- Powerful method proposed by Jones, NIM A488 (2002) 471
- Low-energy transitions highly converted, look for Recoil-electron- α correlated chains in DSSSD
- Isomer confirmed in several experiments: Butler et al., Acta. Pol. B34 (2003) 2107, Mukherjee et al., AIP Conf. Proc 764 (2005) 243
- Recent experiments carried out at ANL and JYFL

The Future....

- Simultaneous Electron-Gamma Measurements
- Combine Digital Electronics with TDR
- Unique and Powerful Device for Spectroscopy of Heavy Nuclei

- Progress to $Z=104$ - ^{256}Rf @ 12 nb!
- Lighter beams / Radioactive Targets e.g. ^{256}No
- Still many cases to be studied e.g. ^{255}No , ^{248}Fm , ^{249}Md
